

Sailing Without Seas

Dark voids lure fools to cold and silent peril

Intra-System Travel

Space travel within a star system is fairly mundane and typically requires no tests of skill nor risk of mishap. Space within a star system is divided into *Regions* describing the general areas around a planet, fortified arrival zone, pirate astroid lair, or other significant object in the star system

Travel Time

Base travel time within a *Region* is **6 hours** and between *Regions* is **48 hours**

Actual travel time is the *Base travel time* divided by ship's spike drive rating. Pilots can **trim the course** to increase their ship's effective spike drive rating **+1** by making an **INT/Pilot check vs DC 9**. On failure, this results in **2x** travel time

Detection and Evasion

Ships in space are difficult to spot without a *Detection Lock*. Once locked, a ship can be tracked anywhere within the star system until the lock is broken

Detection Lock make an opposed **INT/Program** skill check vs *Comm Officer* on target **using modifiers** below. Target must be in same *Region* as observer. A locked target knows that it is locked unless observer is using *Passive Sensors*

Breaking Lock requires locked ship to leave *Region* and make an additional opposed **INT/Program** skill check with the same conditions as when making the lock

Observer	Mod	Target	Mod
Fighter	+0	Fighter	+3
Frigate	+1	Frigate	+2
Cruiser	+2	Cruiser	+1
Capital	+3	Capital	+0
Minor Outpost	+2	Station	-2
Major Station	+4	Avoiding Pop Centers	+2
Planet	+5		
Passive Sensors	-2		

Pursuit and Escape

Locked targets know they are locked, but only know they are being pursued if they in-turn have a lock on the pursuer.

Engage in Pursuit target must be in same *Region* and have active *Detection Lock*. Make opposed **INT/Pilot** with target *Comm Officer* with each side **adding** their ship's **spike drive rating**. If pursuer beats or ties target, they force *Engagement* and both ships move within **Combat Range**. If the target beats the pursuer, they get a 6 hour x spike drive rating difference between ships distance from pursuer

Interstellar Travel

Travel between star systems involves Spike Drilling into Metadimensional Space, a feat filled with random danger requiring time, skill, and luck to survive and arrive at the desired location

Spike Drills

To drill into metadimensional space, a ship needs to be located at the transitional zone on the outskirts of a star system. A ship may travel in any metadimension when leaving a system, but may only arrive in the closest transitional zone upon arrival. Rutters are charts of current metadimensional currents that can aid drill navigation

Spike Drill travel up to a metadistance equal to a ship's **spike drive rating** by making an **INT/Pilot** skill check vs **DC** as calculated below. Pilots may **trim the course** to increase their ship's effective spike drive rating **+1** at greater difficulty. Each drill requires **1 load of fuel** and takes **30 min (2 rounds)** to initiate. Pilots can rush to halve this time at additional difficulty. **Failing** the check indicates a **mishap** to be rolled on the table below

Spike Drill DC

Base difficulty for a Spike Drill	7
The course is totally uncharted	+6
The rutter is more than 5 years old	+2
The rutter is from 1 to 5 years old	+1
The rutter is less than 1 year old	+0
The rutter is less than 1 month old	-2
The drill's distance per 2 full hexes	+1
Trimming the course	+2
Drill activation rushed	+2

Spike Drill Mishap 3d6

3	Catastrophic dimensional energy incursion Ship emerges around a star within 1d6 hexes of target destination with all systems destroyed
4-5	Sheer surge overwhelms internal systems Ship emerges around star nearest drill origin. 50% chance for each system to be disabled. If Spike Drive is disabled, then treat as if a 3 was rolled
6-8	Power spike. One system disabled until repaired Ship is stuck in transit for full base time before being able to make another Pilot check. If Spike Drive fails, treat as if a 3 was rolled
9-12	Ship off course. Spend base time in transit then make another Pilot check
13-16	Ship off course, but detected early. Make another Pilot check
16-17	Drill successful but takes twice base time
18	Drill successful and on time by blind luck
